

ISO 42001 AI Governance Assessment

Lightweight AI management system assessment for the Helios AI-powered energy forecasting scenario.

Purpose

This assessment demonstrates awareness of AI governance requirements relevant to ISO/IEC 42001 and NIST AI RMF. It focuses on governance controls for AI systems used in energy demand forecasting.

AI Risk Areas

AI Governance Area	Risk	Suggested Control	Evidence / Artefact
AI system inventory	AI workloads not formally tracked	Maintain AI system register	AI Governance Assessment
Data quality	Poor inputs affecting forecasting accuracy	Define data quality checks	Data validation log
Bias / fairness	Uneven model outcomes or inaccurate forecasts	Review model assumptions and outputs	Model risk review
Human oversight	Automated decisions without review	Define approval workflow	Governance process
Security & privacy	Sensitive data leakage through AI pipeline	Access control, logging and data minimisation	Azure policy / GDPR overview

Recommended Next Steps

- Create an AI system inventory
- Define ownership for each model
- Document data sources and assumptions
- Introduce model risk assessments
- Retain evidence of governance reviews

Prepared as part of the Helios Azure Cloud Governance & GRC portfolio case study.
